- 387 Coming in over a high lead logging system in the steep Douglas fir region is a turn of three logs. They are suspended by choker cables from the heavier cable threaded through the big carriage riding the aerial tramway. In steep country like this the logs frequently ride clear of the ground in crossing deep canyons, which the overhead cable spans by being rigged between two sturdy spar trees, one on each side of the canyon.
- 388 The rigging used on a spar tree in the Douglas fir region is an intricate system of cables used to brace or guy the tree and other cables which pass through blocks and then out to the woods for fastening to logs. It requires skill and knowledge to rig such a tree for safe logging.

Research Forests-General and Unidentified Views

Images catalogued and described as a part of cultural resource inventory surveys from 1990 to 1995 which listed photographs, negatives, and slides held by the OSU Research Forests. Most are in the form of slides identified by a code number (XLHZ5001, for example) that correspond to a particular subject or origin. Many of these images were shot by MAIS student and consultant Bob Zybach, who worked on the inventory projects. Other images are reproductions of historic photographs collected through oral history projects as well as U.S. Geological Survey and the U.S. Forest Service images that were originally featured in publications. Primarily reflecting the McDonald-Dunn Forest and the surrounding region, these images also document forestry operations (including reforestation and native tree planting) in Lincoln County and the town of Valsetz. The historic views depict the Soap Creek Valley, logged-over areas in the Oregon coast range, and family farms/homesteads of some of the oral history subjects. Cataloging worksheet information and inventories of these images are stored in the same box.
